

ABSTRACT OF THE DISCLOSURE

5 A content data distributing system includes a first
information processing apparatus connected to a first network
having a mobile communication function, and a second information
processing connected to a second network which, in turn, is
connected to said first network. The first information
processing apparatus receives, over the first network, a content
identification of a content determined by a user and an address
10 of a third information processing apparatus determined by the
user which is to receive data of the content, and transmits the
received content identification and third information processing
apparatus address to the second information processing apparatus
over the first and second networks. The second information
15 processing apparatus receives the content identification and the
address of the third information processing apparatus and
transmits content data associated with the content
identification received to the third information processing
apparatus over the second network.
